Key Words:
Nutrition; malnutrition; nutritional screening

Policy Applies to:
Nursing, Food services staff and Dietitian

Related Standard:
EQuIP Criterion 1.1.1 - The assessment system ensures current and ongoing needs of the consumer/patient are identified. 
EQuIP Standard 1.5; criterion 1.5.7 - The organisation ensures that the nutritional needs of patients are met.

Rationale:
Good nutrition is important for an individual’s physical health and general sense of wellbeing, particularly those who have undergone surgery. Patients rely on the hospital to provide nourishing, appetising and visually appealing foods that are acceptable in terms of patients’ cultural, nutritional and psychosocial needs.

Definitions:

Nutritional care: A coordinated multi-disciplinary approach to providing appropriate food and beverages that meet the patients’ needs and preferences during their stay in hospital.

Malnutrition: Malnutrition in this context refers to a deficiency in protein and energy, with or without micronutrient deficiencies.

Nutritional screening: Objective classification of a patient’s risk of malnutrition using a validated and reliable nutritional screening tool i.e. Adult Failure to Thrive Screening Tool adapted from Malnutrition Universal Screening Tool (MUST).

Nutritional support: Maximising an individual’s food intake which may include supplementary nutrition in the form of ready-made oral liquids e.g. Ensure, Fortisip

Objectives:
- Through nutritional screening, identify patients with pre-existing malnutrition and those at risk of hospital malnutrition.
- To initiate nutritional support and/or dietitian input if necessary.
- To ensure Mercy Hospital provides nutritious, high quality food and beverages of sufficient variety to meet the needs and expectations of patients.

Implementation:
- A system for undertaking nutritional screening using a validated tool is in place.
• Staff education and training is undertaken i.e. use of the Adult Failure to Thrive screening tool;
• Dietitian has a regular slot on Clinical Orientation of new staff to support implementation of the policy.
• Pre-admission and admitting nurses are alert to patients with potential nutritional needs e.g. chronic bowel conditions.
• Staff responsibilities are clearly defined (Appendix 1)

Evaluation:
• Patient feedback forms and Patient Questionnaire
• Percentage of patients who state food is excellent or very good or higher is > 90%
• 100% of in-patients are screened for malnutrition.

Process

- Nutritional screening of adult in-patients is undertaken by using the Adult Failure to Thrive Screening Tool (ref: clinical services work manual for BMI chart, weight loss chart and screening tool).
- The pre-admission nurse and admitting nurse have responsibility for completing the tool and documenting the score on the nursing assessment form. Screening is repeated after 7 days if the patient remains in hospital and had a score of 0 on admission.
- Patients with a score of 1 (medium risk) will be managed as per the guidelines i.e. documentation of dietary intake for 2 days or notification to the GP/practice nurse if patient discharged prior.
- Referral to a dietician will be offered to any patient identified with a screening score of 2 (High risk). If the referral is declined, a high energy, high protein (HEHP) meal plan (ref: clinical services work manual) will be put in place with additional snacks and fortified meals and the GP / practice nurse notified by nursing staff on discharge.
- Menus fulfil the nutritional requirements of both adult and paediatric patients. Menus are varied, comply with New South Wales (NSW) nutritional guidelines and the presentation of meals is visually appealing.
- Patients are provided with written & verbal information about meal services and have the opportunity to select food and beverages from a menu. Meals are ordered one day ahead.
- Meals are adapted to ensure patients’ preferences, allergens and complex dietary requirements are met.
- Dietary preferences and food allergies are recorded on TrakCare and TrendCare and are accessed by the kitchen and ward / DSU/Manaaki staff.
- In consultation with the surgeon, patients undergoing colo-rectal surgery and Nissen Fundoplication are referred to the dietician for assessment and nutritional support as appropriate. Depending on the surgery, this may occur pre-operatively or with 48 hours post operatively.
- Food is delivered at specified times each day. Patients that attend pre-admission clinic are asked to select from the post op menu; guidance on appropriate choices is given by the Pre-admission Coordinators. However, the patient’s choice may be changed by nursing staff depending on their condition following surgery. Post-op menus are placed in the patient’s clinical notes and are delivered to the kitchen on the morning of surgery.
- In-patients, who do not attend a pre-admission clinic, complete a menu on arrival in DSU.
- Mealtimes should be free of interruptions and conducive to eating.
- Preparation of patients for meal service and assistance with eating and drinking is provided in a timely manner by nursing staff, food services staff or ward assistants.
